

I oppose the "wire-tapping" of Voice over IP (VoIP) communications. This practice has the potential to be greatly abused. The manipulation sniffing and inseratation of packets with only cause encryption to get better and be applied to (VoIP). Isn't carnivore enough to capture the data you need. VoIP can be implemented on unlicensed frequencies and then Ad-hoc networks can be established. Private communications should not be monitered more than they are today. Tap the Data Line and Decode it (DSLAM + Cable or CSU/DSU). Wiretapping and IP-tapping should be kept separate, more meaning keep the crap out of ISP's and keep it at the phone companies Co-Location. I assume that you will approve the tapping of VoIP anyway so enjoy, and try not to ruin a good thing.
